

GOVERNMENT OF GOA

A  
**REPORT ON**  
**AGRICULTURE INPUT SURVEY**  
**2016-17**

DIRECTORATE OF PLANNING, STATISTICS & EVALUATION

PANDIT DEENDAYAL UPADHYAY BHAVAN

PUNDALIK NAGAR, PORVORIM - GOA

## **PREFACE**

The Ministry of Agriculture and Farmers Welfare, Government of India, conducts the quinquennial Agriculture Census in three phases throughout the country in order to create a sound and reliable database for planning and policy formation of the agriculture sector at the national as well as State level. Goa is a participant in this National level program since its inception.

The Input Survey forms the third phase of the Agriculture Census. The Directorate of Planning, Statistics and Evaluation has conducted the 9<sup>th</sup> Agriculture Input Survey with reference year 2016-2017 as a part of the 10<sup>th</sup> Agriculture Census 2017-18.

This Report presents the results of the Agriculture Input Survey 2016-2017 carried out in Goa by adopting the concepts, definitions and methodology evolved by the Ministry of Agriculture and Farmers Welfare, Government of India.

The efforts of the Officers/Officials involved in the conduct of the fieldwork of the Input Survey and bringing out this Report is appreciated.

This Report will serve as an important and useful official document for Planners, Policy-makers and Researchers in the field of Agriculture.

**Dr. Y. Durga Prasad  
Director, DPSE &  
Dy. Agricultural Census  
Commissioner**

Porvorim – Goa  
Dated : May, 2022

## **CONTENT**

### **PART – I: AN OVERVIEW**

<b>Sl. No.</b>	<b>Contents</b>	<b>Page No.</b>
1.	Introduction	1-4
2.	Objective, Reference Period, Coverage	5
3.	Methodology	6-7
4.	Concepts and Definitions	8-12
	(i) Operational Holdings	
	(ii) Parcel	
	(iii) Holder or Operator	
	(iv) Total Area of Holdings	
	(v) Agricultural Production	
	(vi) Land Utilization	
	(vii) Integrated Pest Management	
	(viii) Fertilizers	
	(ix) Crop-wise Area – ( Irrigated and Un-irrigated)	
5.	Analysis of Census Results	13-20

### **PART – II : STATISTICAL TABLES**

Table 1	: Estimated number of parcels per operational holding and average area per parcel by size groups.	21
Table 2A	: Estimated area cropped once and more than once in irrigated areas by size groups.	22
Table 2B	: Estimated area cropped once and more than once in unirrigated areas by size groups.	22
Table 3	: Estimated area under all crops and usage of chemical fertilizers by size groups.	23
Table 3A	: Estimated area under all crops treated with fertilizers by size groups.	24-30
Table 4	: Estimated area under crops and usage of chemical fertilizers by size groups.	31-32
Table 4A	: Estimated area under the crops treated with fertilizer by size groups.	33-46
Table 5A	: Estimated area under all crops treated with FYM/compost/ biogas manures by size groups.	47

Table 5B	: Estimated area under all crops treated with oil cakes by size groups.	48
Table 5C	: Estimated area under all crops treated with other organic manure by size groups.	49
Table 5D	: Estimated area under all crops treated with chemical pesticides by size groups.	50
Table 5DA	: Estimated Area under all crops treated with Bio Pesticides by size groups.	51
Table 5E	: Estimated area under all crops treated with FYM/compost/ biogas manures by size groups.	52-53
Table 5F	: Estimated area under the crops treated with oil cakes by size groups.	54-55
Table 5G	: Estimated area under crops treated with other organic manure by size groups.	56-57
Table 5H	: Estimated area under all crops treated with chemical pesticides by size groups.	58-59
Table 5LA	: Estimated area under crops treated with green manure by size groups.	60-61
Table 5M	: Estimated area under all crops treated with Rhizobium by size groups.	62
Table 5N	: Estimated area under all crops treated with Azetobactor by size groups.	63
Table 5O	: Estimated area under all crops treated with blue green algae by size groups.	64
Table 5P	: Estimated area under all crops treated with PSB by size groups	65
Table 5PA:	: Estimated area under all crops treated with green manure by size groups.	369
Table 5PB	: Estimated area under all crops treated with Azospirillum by size groups	67
Table 7A	: Estimated number of operational holdings who owned and used Agricultural Machinery by size groups.	68-70
Table 7B	: Estimated number of operational holdings who hired Agricultural Machinery by size groups	71-73
Table 8	: Estimated institutional credit taken for agricultural purposes by size groups.	74-76
Table 9A	: Estimated number of holders who used certified seeds (Blue Tag) etc. for agricultural purposes	77
Table 9B	: Crop-wise distribution of operational holdings used certified seed.	78
Table 9C	: Crop-wise distribution of operational holdings used Hybrid Seed	78
Table 9D	: Number of operational holdings by usual methods of soil test and pest control and area covered under soil test.	79
Table 10	: Estimated number of operational holders by education status.	80
Table 11	: Average age of operational holders (years).	81
Table 12	: Average size of household of operational holders (in numbers).	82

## **Introduction:**

Agriculture Input Survey constitutes the third phase of the main Agriculture Census which is conducted in 3 phases. Considering the fact that agriculture is the predominant sector of India's economy, the Ministry of Agriculture and Farmer's Welfare, New Delhi, has been conducting the Agriculture Census throughout the Country every quinquennial year since 1970-71. It is a large-scale statistical operation for collection and derivation of quantitative information about the structure of agricultural holdings in the country which is the ultimate unit for taking decisions for development of Agriculture at micro level. The relevant information for micro level agricultural planning is gathered through the first and second phases of Agriculture Census.

In Goa too, agriculture is an important sector of the economy. The Directorate of Planning, Statistics and Evaluation has conducted the 9<sup>th</sup> Agriculture Input Survey with reference year 2016-2017 as the 3<sup>rd</sup> phase of the 10<sup>th</sup> Agriculture Census 2017-18. This Report presents the results of the Agriculture Input Survey 2016-2017 carried out in Goa by adopting the concepts, definitions and methodology evolved by the Ministry of Agriculture and Farmers Welfare, Government of India. An "Operational Holding" for the purpose of Agriculture Census is defined as "all land which is used wholly or partly for agricultural production and operated directly or managed as one technical unit by one person alone or with others without any regard to the title, legal form, size or location. A holding may consist of one or more parcels of land provided they are within the same Taluka and form part of the same management and has the same means of production such as labour force, machinery and other inputs". Agricultural land operated outside the boundaries of the State is not considered.

The Input Survey involves collection of various information on the use of major inputs like seeds, fertilizers, manure and pesticides, irrigation, agricultural machinery and implements etc., related to the agricultural holding. The data is collected through oral enquiry from selected operational holders in sample villages.

## **Topography and Demography:**

Formerly a part of the erstwhile Union Territory of Goa, Daman and Diu, Goa attained Statehood on 30<sup>th</sup> May, 1987. The smallest of States in the country, Goa is situated on the western coast of the Indian Peninsula and between the coastal borders of Maharashtra and Karnataka. It is bounded in the North by the Terekhol River which separates it from Maharashtra State, in the East and South by Karnataka State and in the West by the Arabian Sea.

Goa has a geographical area of 3,702 km<sup>2</sup> with hilly terrain especially on its eastern side, where lies the southern end of the Sahyadri ranges. These mountains, after skirting a considerable portion of the northeastern and southeastern boundaries, branch off westward across the State with many spurs and ridges. The terrain is interspersed by a number of rivers flowing westwards, which provide a network of internal waterways. The altitude of the towns in Goa range between 20 and 62 meters above sea level.

Goa is acclaimed as a world renowned tourist destination with its vast coastline admeasuring 105 kms from Terakol in Pernem, North Goa, to Polem in Canacona, South Goa dotted with picturesque beaches, creeks and estuaries rich in marine fauna formed by the rivers which provide a good shelter for fishing crafts.

Panaji is the Capital city of Goa. The State is divided into 2 districts viz. North Goa District and South Goa District comprising 12 Talukas/Tehsils constituting 384 habitated villages governed by 191 Village Panchayats and 14 Municipal Councils. Goa is regarded as one of the most developed Indian States in terms of literacy (89%) and public infrastructure.

## **Soils in Goa**

The climate topography, geology and vegetation have played a prominent role in the development of the soils in the State. The soils in general are lateritic. The agricultural low lands, especially in the coastal track are alluvial flats formed through sedimentation along the principal rivers. In many cases, they are protected by dykes. Along the coastline there are sand dunes, too dry and barren to sustain any agricultural crops except cashew and coconut.

Most of the remaining land much of which classified as forests originates from Archaean rock formations which are very thick. In the highlands, laterite covers gneiss and hypogenic rocks, from which iron ore is mined extensively. The soil is murum on the slopes. Many commercial tree species thrive in the well aerated soils at the foothills, where the murum is mixed with humus to form a loamy soil, and where the growth is often thick and high. In the valleys where the perennial natural water springs occur, arecanut plantations interspersed with spice crops and other fruit bearing trees generally termed as ‘kulaghars’ are seen.

The soils in Goa State can, therefore, be classified into three categories viz. (1) Laterite or Lateritic, (2) Alluvial and (3) Sandy. About 2,75,900 Ha. are of the first category and are highly acidic in nature, sandy loam to silt loam in texture and well drained. They are poor in lime, phosphorus and potash but fairly good in organic matter and nitrogen. About 24,950 Ha. are alluvial, 17,600 Ha. of which are subject to inundation of saline water and have to be protected by bunds to grow crops successfully. The nine kilometers coastal inland comprise a stretch of 38,000 Ha. half of which has a high water table and could be exploited for irrigation and multiple cropping. These soils are also acidic, sandy to sandy loams, fairly rich in organic matter but very deficient in phosphate and potash.

### **Rainfall and temperature**

The climate in Goa is generally warm and humid and the year round temperature varies from  $18^0$  C to  $34^0$  C. Among all the towns of the Goa State, the altitude of Mormugao town is the highest i.e. 62 mts above the sea level. Since the towns are situated very near to the coast, the maximum temperature seldom exceeds  $34^0$  C and the minimum seldom falls below  $18^0$  C.

Being located on the west coast of India, it receives copious annual rainfall of about 2,500 to 5,000 mm from South-West monsoons for a short period of four months from June to September. Short lengths of rivers, deep marine ingress, steep slopes in the Western Ghats and reserved forests pose constraints for large storage structures. Due to thin soil cover and highly rugged configuration of the topography, heavy rainfall leads to high run

off rendering the period from November to May dry. Rainfall pattern is heaviest on the mountain ranges and its western slopes i.e. 5000 mm and it gradually reduces towards the coastal plains i.e. 2500 mm. Plain land in the State is restricted to a few kilometers from the coastal line and since rivers flowing through the plain lands have very flat slopes at the estuarine reaches, acting as back waters of the sea, the tidal effect is felt right up to the foothills of the Western Ghats. In the western half, where most of the land is below 100 meters in altitude, the rainfall average varies between 2600 and 4000 millimeters and in the eastern half, where the hills and mountains rise to higher altitudes (max. 1,666 mts. above sea level), temperature variations are wider and the rainfall is considerably heavier.

## **Crop Seasons**

Basically, the soil and climate conditions in Goa favour the growth of a wide variety of tropical crops. Crops like paddy, ragi, pulses, beans, other millets and vegetables are grown during Kharif season (from May to August). The important crops which are grown during Rabi season (December to February) are paddy, pulses, beans and vegetables. During the summer season some beans and vegetables are also grown. Coconut, arecanut, cashew, mango, jackfruit are popular among the tree crops. The common fruit crops include breadfruit, papaya, lemon, banana and pineapple. Vegetables such as aramanthus, brinjal, lady's fingers, radish, cucumber, pumpkin, drumsticks, different varieties of gourds etc. are widely grown. Sweet potatoes, onions and chilies are grown wherever irrigation facilities are available. Sugarcane is another crop cultivated on a large scale to cater to the sugar factory in the taluka of Dharbandora in South Goa District.

## **Population Characteristics**

As per the 2011 Population Census, Goa had a population of 14, 58,545 (7,39,140 males against 7,19,405 females) with a density of 394 per Sq. Km. The most populous town in the State is Mormugao with population of 94,393 and Shiroda is the highest populated village with population of 14,041. Jua has been registered as the least populated town having population of 4134. The Sex ratio in Goa stood at 973 during 2011 Population Census as against 961 in 2001 Population Census. Sex ratio of Child population in the age

of up-to six years was 942 and above seven years was 977. The Literate population in Goa was recorded as 11, 65,487 (79.90%).

## **Objectives**

The main objective of the Input Survey is to generate data on consumption of various agricultural inputs, according to major size groups of operational holdings, viz. marginal (below 1.0 Ha.), small (1.0-1.99 Ha.), semi-medium (2-3.99 Ha.), medium (4-9.99 Ha.) and large (10 Ha. and above), for gaining an insight into the consumption pattern of inputs, by various categories of farmers' points. This information is vital for planning their production, imports and distribution of fertilizers. The inputs covered in the survey include chemical fertilizers, high yielding variety (HYV) seeds, pesticides, farmyard manure/compost, bio fertilizers, agricultural implements & machinery and agricultural credit.

## **Reference Period**

The reference period for the Input Survey as recommended by the Ministry of Agriculture was 2016-17 (July 2016 to June 2017) though for the agriculture 'Main Census' the reference period was 2015-16 (July 2015 to June 2016). The past practice of Input Survey has been to collect the data separately for kharif and Rabi season. This was recommended to reduce the memory recall lapse. However, since this survey was delayed, it was recommended that the information for both kharif, 2016-17 and Rabi 2016-17 be collected in one go.

## **Items Coverage in the Survey**

The following information was collected according to size classes of operational holdings in Input Survey 2016-2017.

1. Number of parcels
2. Multiple cropping separately for irrigated and unirrigated areas
3. Use of chemical fertilizers, organic manures and pesticides, separately for irrigated and unirrigated areas under crops

4. Use of agricultural equipment and machines
5. Agricultural credit availed
6. Types of seeds used and quality problems
7. Integrated Pest Management (IPM) practices
8. Age, educational qualification of holders and size of household
9. Soil health/Soil testing

## **Methodology**

During the ‘Main Census’, 50% of the villages were selected by using simple random sampling method and in each selected village/ward cent per cent of the operational holdings were covered.

Since, the Input Survey 2016-2017 was restricted only to the rural areas, as per the methodology, 7% villages were selected randomly from all the talukas in Goa, as a stratum from the villages selected for the Agriculture Census 2015-2016. The number of villages thus selected in the State were 29 as under:

	<b>Tiswadi</b>	<b>Sattari</b>	<b>Mormugao</b>
1	Talaulim	11 Dabem	21 Arrosim
2	Neura-o-Pequeno	12 Choraundem	
3	Renovadi	13 Assodem	<b>Quepem</b>
		14 Codal	22 Barcem
		15 Satorem	23 Fatorpa
	<b>Bardez</b>		24 Maina
4	Nerul		
5	Anjuna	<b>Ponda</b>	
6	Camurlim	16 Shiroda	<b>Sanguem</b>
		17 Querim	25 Rubrem
			26 Verlem
	<b>Pernem</b>		
7	Tiracol	<b>Salcete</b>	
8	Poroscodem	18 Sernabatim	<b>Canacona</b>
		19 Navelim	27 Poinguinim
	<b>Bicholim</b>	20 Chinchinim	
9	Maulinguem North		<b>Dharbandora</b>
10	Harvalem		28 Sonauli

In each selected village, the operational holdings were grouped into the following size classes.

<b>Sl. No.</b>	<b>Size Classes</b>	<b>Codes</b>
1	Below 1 Ha.(one Ha. is equal to 10,000 sq. mts)	1
2	1 to 1.99 Ha. (1 Ha. and above but below 2 Ha.)	2
3	2 to 3.99 Ha. (2 Ha. and above but below 4 Ha.)	3
4	4 to 9.99 Ha. (4 Ha. and above but below 10 Ha.)	4
5	10 Ha. and above	5

## CONCEPTS AND DEFINITIONS

### **1. Operational Holdings**

(i) “Operational holding” is defined as “*all Land which is used wholly or partly for agricultural production and is operated as one technical unit by one person alone or with others, without regard to the title, legal form, size or location*”. *The technical unit has been defined as ‘that unit which is under the same management and has the same means of production such as labour force, machinery and animals’*. It can be derived from this definition that the actual cultivator and not only the owner is the unit for collection of data.

(ii) An operational holding will include both cultivated and uncultivated area. For example, an operational holding consisting of four survey numbers out of which, one survey number is put to non-agricultural use; the total area of the operational holding will be equal to the total geographical area of the four survey numbers. The holding will exclude Government forest land, grazing land etc.

### **2. Parcel**

A parcel is all land entirely surrounded by land of other holdings or by land not forming part of any holding. It may consist of one or more cadastral units or plots of fields.

### **3. Holder or Operator**

The holder/operator is the person who has the responsibility for the operation of the agricultural holding. He exercises the technical initiative and may have full economic responsibility (i.e. as owner) for it or share this with others (as a tenant). When two or more persons share jointly (as partners) in the economic and technical responsibility for the operation of an agricultural holding, each is to be considered as the holder if they belong to different households and the holding will be termed as joint holding. For Input Survey, any one of these could be taken as the operational holder and be approached for responding to the questionnaire.

### **4. Total Area of Holdings**

The total area of the holding should include the total of all land forming part of a unit, which is under the same technical responsibility and management. It should also comprise the land occupied by the farm buildings, including the house of the holder, provided such buildings are within the cultivated area. If the farm buildings are located outside the cultivated area and are covered under abadi area, such buildings will not be included in the area of the holding.

## **5. Agricultural Production**

For the purpose of Input Survey, agricultural production would mean the growing of field crops, fruits, nut seeds, trees/plants' nurseries (except those of forest trees), bulbs, vegetables and flowers, production of coffee, tea, cocoa, rubber, jute, oilseeds, fodder grasses etc.

## **6. Land Utilization**

Land Utilization relates to knowing the cropping intensity under irrigated and un-irrigated conditions. As such, for the purpose of input survey land under net sown area is considered.

(i) **Net area sown:** It represents the total cultivated area during the reference year without any regard to the number of times it has been cultivated in a year. Thus, for the net sown area, the areas cultivated more than once during the same year is counted only once. Both field crops and orchards forms part of the net sown area.

Apart from net sown area other folds of land are as follows:-

- (ii) Area under current fallow - This includes all the areas which are usually cropped but have not been cultivated during the reference year.
- (iii) Fallow land other than current fallow
- (iv) Culturable waste
- (v) Permanent pastures and other grazing land
- (vi) Land under miscellaneous tree crops
- (vii) Forests

## **7. Integrated Pest Management (IPM)**

Integrated Pest Management is categorized in four groups such as agronomic and cultural control, mechanical control, biological control and chemical control. IPM is the judicious combination of the above mentioned approaches.

- (i) **Agronomic and cultural practices:** This is a preventive method and it is based upon knowledge of life history and habits of pests. It includes deep ploughing after harvesting a crop to expose the hidden or resting insects, weeding, removing and destroying of stubbles and other trash, adjusting the time sowing to avoid peak incidence period of pests etc.
- (ii) **Physical and mechanical control:** This is one of the oldest methods and includes measures such as collection of eggs and caterpillars (in active stages of pests), removal and destruction of infested part of the plant, beating of drums, laying of night traps and yellow traps. These methods are found effective in the initial stages of the pest incidence when practiced by a large number of farmers in particular areas.
- (iii) **Biological control:** Most of the crops have their natural enemies in the form of parasites and predators and disease causing organisms. These methods are often applied by specialized agencies in conjunction with chemical methods so that harmful effects of insecticides do not interfere with the activities of nature based enemies of pests.
- (iv) **Chemical control:** This method relates to use of insecticides, pesticides and weedicides, in the form of dust, sprays and granules on the crops.

## 8. Fertilizers

- (i) **Chemical fertilizers, Organic manure, Green manure and Bio-fertilizers:** A package of practices are followed for replenishing the loss of nutrients from the soil as a result of cultivation to maintain the fertility of the soil and it involves use of organic manure, green manure, chemical fertilizers and bio-fertilizers.
- (ii) **Chemical Fertilizers:** Chemical fertilizers refer to chemical compounds, which are manufactured in the factories and are used as soil nutrients. These are

classified as “Macro-nutrient” fertilizers which supply nitrogen (N) phosphate (P) and potash (K) and “Micro-nutrient” fertilizers which supply zinc, manganese, copper, iron, and aluminum etc. The popular macro-nutrient fertilizers are – urea, DAP, MOP, CAN and a number of complex fertilizers and their physical mixtures.

- (iii) **Organic manures:** Organic manure is usually not manufactured in a chemical factory and is produced by the farmers in their fields using various types of agricultural waste.
- (iv) **Bio-fertilizers:** Bio-fertilizers require storage at specified temperatures. These carry some living bacteria on an organic base. Bio-fertilizers are rhizobium, azabactor, blue-green algae and phosphate solubilizing bacteria (PSB). When bio-fertilizers are put into the soil, they start their activities e.g. fixing the nitrogen from air to soil.
- (v) **Green manure:** Green manure refers to the cultivation of specific type of vegetation with the intention of ploughing it back in the soil when the leaves are tender and easily decomposable. The popular type of green manures used by the farmers include sesbania (dhencha), sunhemp (sanai), indigo, urd and cowpea.

## 9. SOIL HEALTH

For assessing the soil health status, the State Government has established testing laboratories for testing the PH value, i.e. N (Nitrogen), P (Phosphorus) and K (Potash) values of the soil samples collected from the farmers' fields. Farmers are accordingly, advised by Testing Labs to increase the fertility of the soil by using specific fertilizers and chemicals depending upon the PH values.

## 10. Crop-wise Area (Irrigated and Unirrigated)

Crops are basically classified as food crops and non-food crops as under:

1. **Food Crops:** Food crops include cereals, pulses, spices and condiments, fruits, vegetables and other food crops which are enumerated below:

- (i) **Cereals:** Cereals include rice, jowar, bajra, maize, ragi, wheat, small millets, barley and other cereals.
- (ii) **Pulses:** Pulses include gram, tur, urad, moong, masur etc. and other pulses.
- (iii) **Food-grains:** The total area under cereals plus total area under pulses gives the total area under food-grains.
- (iv) **Spices and Condiments:** Spices and condiments include black pepper chilies, ginger, turmeric, cardamoms, betel-nuts (areca-nuts), garlic, coriander and others.
- (v) **Fruits:** Fruits include mangoes, citrus fruits, bananas, apples, guavas, grapes, dry fruits such as cashew-nut and others.
- (vi) **Vegetables:** Vegetables include potato, carrot, sweet potato, tomato, spinach, brinjal, cauliflower etc.

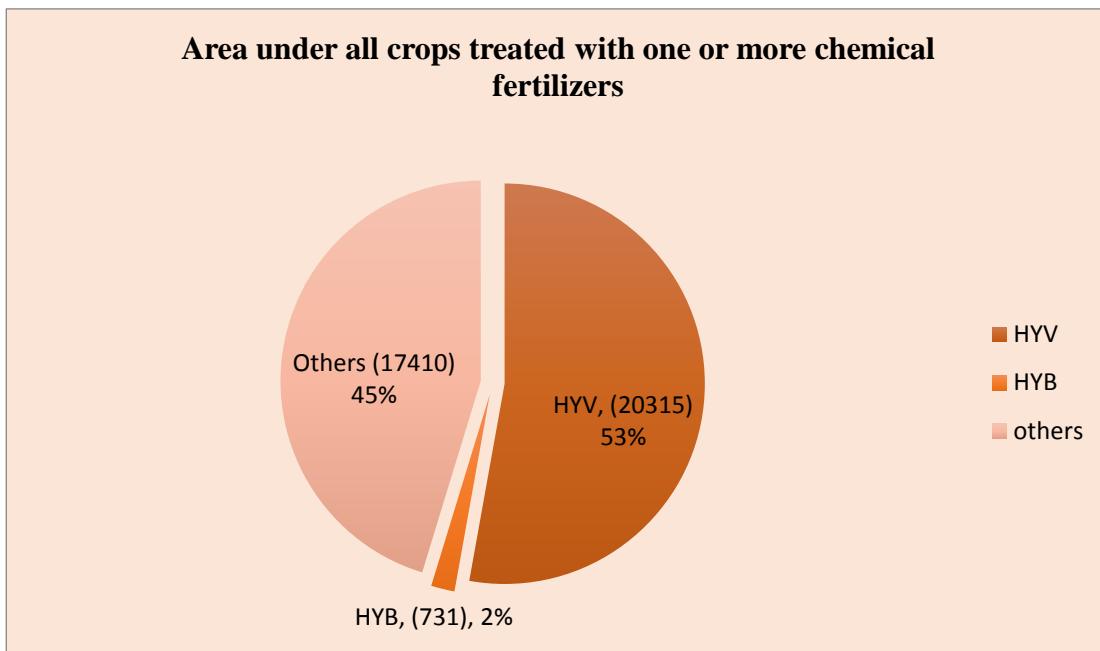

2. **Non-Food Crops:** These include oilseeds, fibres, dyes and tanning material, drugs and narcotics, plantation crops, fodder crops, green manure crops, medicinal plants, floriculture crops and other non-food crops.
- i. **Oilseeds:** Oilseeds include groundnut, caster seed, sesame, rapeseed, and mustard, linseed, coconut, niger-seed, safflower seed, cotton seed and other oilseeds.
  - ii. **Fibres:** Fibres include cotton (lint), cotton (kapas), Jute mesta, sun-hemp.
  - iii. **Plantation crops:** Plantation crops include rubber, tea and others.
  - iv. **Fodder crops:** Fodder crops include guar, oats and other fodder crops.
  - v. **Dyes and tanning material:** These include indigo and others.

## Analysis of Census Results

The data collected under the Input Survey 2016-17, is tabulated in 12 nos. of main tables. The data is grouped in 5 nos. of classes on the basis of size of operational holdings, the lowest size class being area operated below 1.0 Ha. and the highest being 10 Ha. and above. These tables depict information on the use of major inputs by usage of man-power like seeds, fertilizers, manure and pesticides, irrigation, agricultural machinery and implements available etc. The analysis of the Report is as under:

- The total number of operational holdings in the State during the year 2016-2017 were recorded as 74,449 with an area of 76,079 Ha. of land. The total holdings consisted of 1,03,459 nos. of parcels of which 1,02,140 (98.73%) nos. of parcels were located within the village of residence and the rest 1,319 (1.27%) nos. of outside the village of residence but within the district. The average number of parcels per holding was estimated at 1.39, while the average area per parcel and per holding was estimated at 0.74 Ha. and 1.02 Ha. respectively, as can be seen in **Table 1**.
- It is observed in **Table 2A** that the total irrigated area under ‘cropped only once’ during the reference period accounted for 20,307 Ha. and ‘cropped twice-one crop irrigated’ accounted for 1,951 Ha. Thus the net and gross irrigated area cropped remains the same at 22,258 Ha. for all the size groups of holdings. While **Table 2B** shows that the unirrigated area which is cropped once is found to be 49,898 Ha. and cropped more than once is 938 Ha. for all size group holdings. The area irrigated and unirrigated accounted for 29.26% and 66.82% respectively, of the total operated area whereas the current fallow and other uncultivated land was around 3.92%.
- During the year 2016-17, all the 74,052 nos. of holdings in the State comprised of 36,767 nos. of irrigated and 60,092 nos. of unirrigated holdings of which 28,016 nos. of irrigated and 35,305 nos. of unirrigated holdings were treated with one or more chemical fertilizers (*Note: irrigated + unirrigated may be equal or greater than total holdings*). The irrigated holdings were distributed in 22,258 Ha. of land of which high yielding variety (HYV) crops accounted for 5,997 Ha., Hybrid (HYB) 606 Ha., and ‘other’ crops were 15,655 Ha. of land. As far as unirrigated holdings are concerned,

14,945 Ha. of area was under HYV crops, 546 Ha. under HYB and 38,234 Ha were under other crops. The area under all crops treated with one or more chemical fertilizers was 5,885 Ha. and 14,429 Ha. respectively being irrigated and unirrigated area under HYV crops. Area under HYV crops treated with one or more chemical fertilizers was recorded at 522 Ha. and 209 Ha. under irrigated and unirrigated land, while area under other crops was recorded at 8,400 Ha. under irrigated and 9,010 Ha. under unirrigated land.

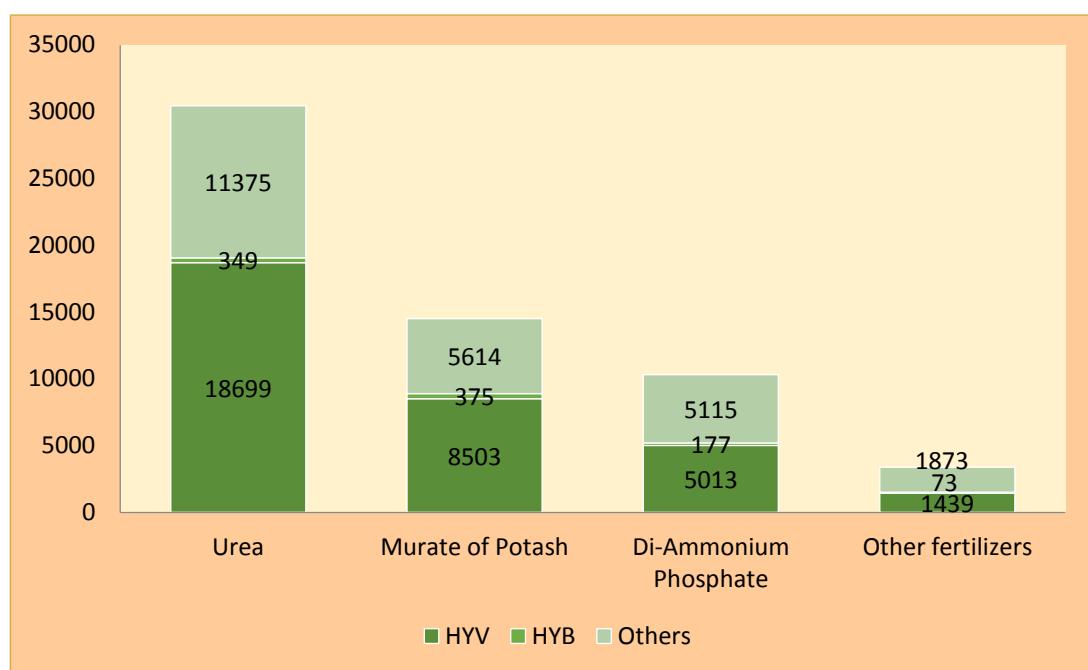

- **Table 3** depicts area under all crops and usage of chemical fertilizers. Area under all crops treated with one or more chemical fertilizers for HYV crops under irrigated or unirrigated area were 5,885 Ha. and 14,429 Ha. respectively. With regard to HYB, it accounted for 522 Ha. and 209 Ha. While for ‘Others’ under irrigated or unirrigated area it accounted for 8,400 Ha. and 9,010 Ha.

The size group-wise total chemical fertilizers used under nitrogen, phosphate and potash (NPK) is given in **Table no. 3**. The distribution of nutrients applied to HYV crops grown were 1,254 MT of nitrogen, 969 MT of phosphate and 298 MT of potash. While for HYB crops, 36 MT of nitrogen, 25 MT of phosphate and 27 MT of potash were provided by the cultivators to their crops. With regard to other crops, the

distribution of nutrients applied were 961 MT of nitrogen, 491 MT of phosphate and 624 MT of potash. It is seen from the above figures that NPK fertilizers used under HYB is less as compared to HYV and other crops.

- The kind of fertilizers mostly used by the operational holders for raising their crops were urea, murate of potash, di-ammonium phosphate (18:46:0) and NPK mixtures along with other fertilizers. The application of these fertilizers to all the crops grown under HYV, HYB and other crops whether irrigated or unirrigated for different size groups of holdings can be seen in **Table 3A**.

#### **Area under all crops treated with fertilizers (Area in Ha.)**

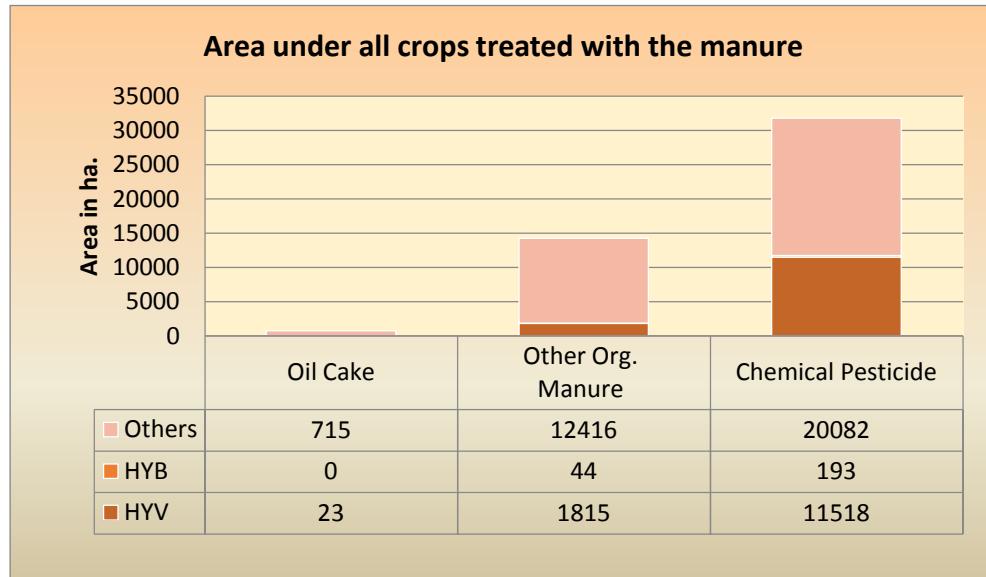

In particular, 3,619 MT of urea was used for crops irrigated and un-irrigated and for an area of 30,423 Ha. under HYV, HYB and other crops by all size groups of operational holdings. Similarly, doses of 1582 MT. of murate of potash and 3,097 MT of di-ammonium phosphate (18:46:0) were given to an area of 14,492 Ha. and 10,305 Ha. of land respectively whether irrigated or unirrigated for all the size groups of operational holdings. Other variety of fertilizers were used in a lesser quantity, which collectively accounted for 281 MT in an area of 3,385 Ha.

- Application of chemical fertilizers to food crops and non-food crops were of the order of 4,016 MT and 668 MT respectively of which composition of N, P and K was 54%, 34% and 12% for food crops and 15%, 20% and 65% for non-food crops respectively covering HYV (63%), HYV (2%) and others (35%) under food crops and HYV (2%), HYB (0.18%) and others (97.82%) under non-food crops. Interested researchers may refer **Tables 4 and 4A** for details of distribution of application of fertilizers by each size group holdings whether irrigated or unirrigated, as also applied nutrient quantity under HYV and other crops for different size groups of holdings.
  
- During this Input Survey 12,849 nos. of holdings were recorded treating crops with FYM/compost/biogas manure etc. Out of these, 4,720 nos. of holdings were irrigated and 9,563 nos. were unirrigated. The total area under these 12,849 nos. of holdings was 6,557 Ha. and applied 11,726 MT of manure in total. The area under HYV, HYB and other crops was 4,197 Ha., 287 Ha. and 2,073 Ha. respectively that received manure to the tune 7,595 MT, 297 MT and 3,833 MT whether the land was irrigated or unirrigated.

The details of size group-wise holdings and area treated with FYM/compost/biogas manure and quantity are shown in **Table 5A**.

- **Tables 5B, 5C and 5D** gives information about estimated area under all crops treated with oil cakes, other organic manures and pesticides by size groups, number of holdings using them and the crops - HYV, HYB or others for which it is used. It is observed that 1,288 nos. of holdings used oil cakes and 17,865 nos. of holdings treated crops with other organic manure. Farmers with 31,363 nos. of holdings having an area of 31,793 Ha. under HYV(11,518 Ha.), HYB (193 Ha.) and under other crops (20082 Ha.) also treated their crops with pesticides for protection from pests, of which 7,702 Ha. of land was irrigated and 24,091 Ha. of land was unirrigated.

Area under food crops and non-food crops accounted for 5,943 Ha. and 613 Ha. respectively and applied either FYM, compost or bio-gas manure to the tune of 10,340 MT and 1,386 MT respectively. The percentage of this manure for HYV, HYB and other crops was 73%, 3% and 24% under food crops with corresponding area estimated at 71%, 5% and 24%. Similarly, the percentage of FYM, compost or bio-gas manure for HYV, HYB and other crops for non-food crops was 0%, 0% & 100% for non-food crops whether irrigated or unirrigated for all size groups of holdings, as seen in **Table 5E**.

- **Tables 5F, 5G, 5H, 5LA, 5M, 5N, 5O, 5P, 5PA and 5PB** represent distribution of estimated area under food crops and non-food crops treated with oil cakes, other organic manure, pesticides, rhizobium, azetobactor, blue green algae, phosphate solubilizing bacteria (PSB), azospirillum and green manure respectively by size group of holdings, number of holdings in each category of HYV, HYB or other crops whether irrigated or not and the manure applied during the period of reference of survey.

It is observed that pesticides are used in most of the operational holdings. The area treated with pesticides under food crops for HYV, HYB and others was 11,458 Ha., 193 Ha. and 17,191 Ha. respectively. With regard to non-food crops, it accounted for 60 Ha., and 2,891 Ha. under HYV and others category except HYB where there was no usage. It is also observed that rhizobium, blue green algae,

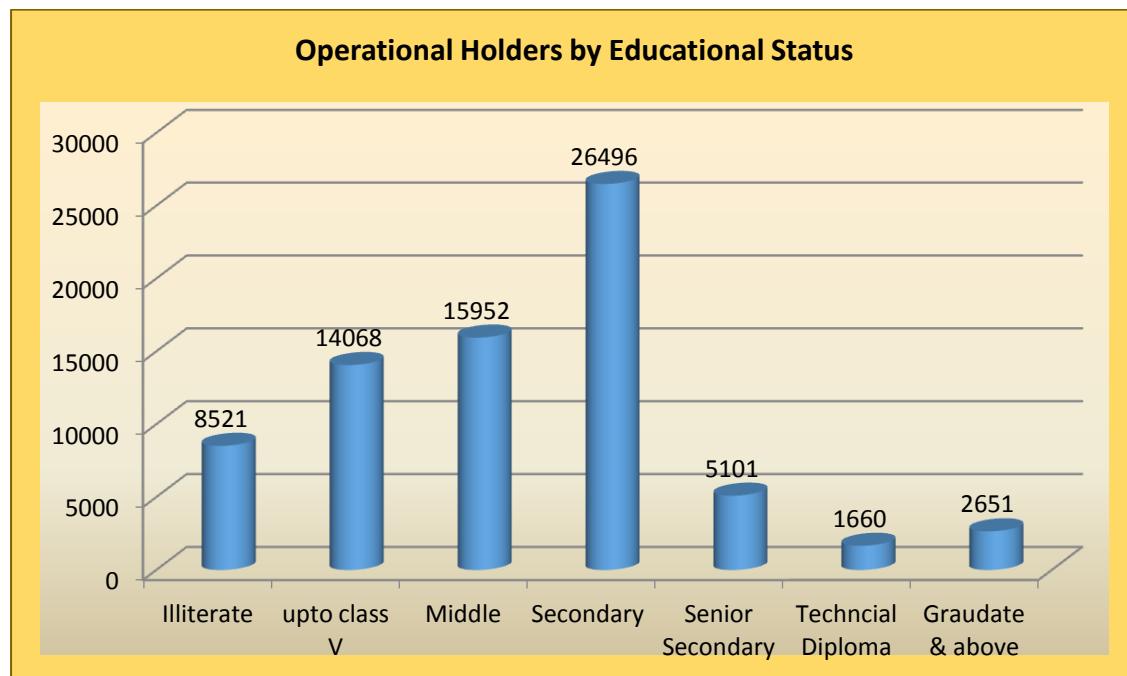

azetobactor, azospirillum and PSB were not used in even a single operational holding, however an area of 455 Ha. and 310 Ha. under food and non-food crops respectively was treated with green manure.

The information with regard to number of agricultural machinery used, credit obtained from institutions for agricultural purpose, use of certified/notified seeds by operational holders and method of soil tests and pest control and area covered under soil test by size groups of holdings can be seen in **Tables 7A to 9D**.

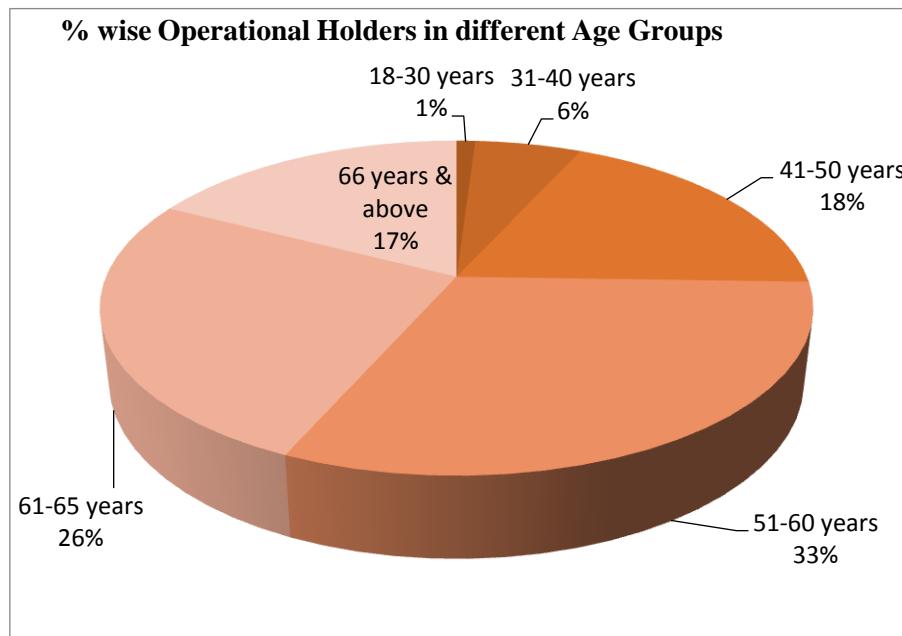

- It was evident during the survey, that farmers used a variety of agricultural implements/equipment owned by them whether hand operated, animal operated or power operated. The hand-hoe was reported as the highest hand operated implement (49,614 nos.) used by the operational holdings. The least hand operated implement was the hand operated sprayer/duster (944 nos.). Among the animal operated implements, the wooden plough was the most commonly used (3,505 nos.) and the least utilized was the ‘others’ at 925 nos. With regard to power operated implements, electric pump set was the highest at 16,862 nos. among the power operated implements and hedge trimmer was the lowest with 73 nos. Detail data is given in **Table 7A**.
- Hired agricultural implements/equipment were also used during the survey, whether hand operated, animal operated or power operated. The Hand operated sprayer/duster was reported as the highest hand operated implement (547 nos.) used by the operational holdings. The pedal operated thresher (110 nos.) which is not popular in the State was the least hand operated implement. Among the animal operated implements, the wooden plough was the most commonly used (1,022 nos.) and the least utilized was the animal drawn paddler at 151 nos. With regard to power operated implements, power tiller was the highest at 24,923 nos. among the rented power operated implements and power sprayer was the lowest with 113 nos. More details are given in **Table 7B**.
- The total number of operational holdings for which institutional credit was availed were reported at 17,347 nos. Primary Agricultural Credit Society (PACs) disbursed loan to 878 nos. of operational holders and Commercial Bank (CBB) disbursed loan to 16,866 nos. of operational holders. It is observed that no operational holder

availed loan from Primary Land Development Bank/Branch of SLDB and Regional Rural Bank (RRR). The short term, medium term and long term loan availed has been recorded at Rs.536 crore, Rs.167 crore and Rs.0.38 crore respectively. The total loan disbursed through Institutional Credit was Rs.703 crore. Out of the Short term loan of Rs.536 crore, Rs.14.94 crore were utilized towards fertilizers, Rs.210.82 crore on other inputs and Rs.310.11 crore were availed in cash. The details are portrayed in **Table 8**.

- **Tables 9A to 9D** depict data pertaining to the use of certified seeds, hybrid seeds, soil tests and pest control in land holdings. Out of 74,449 nos. of holdings, certified seeds were used in 32,904 nos. of holdings and hybrid seeds were used in 1,945 nos. of holdings. With regard to pest control, various methods of pest control were adopted in 54,501 nos. of holdings whereas 19,948 nos. of operational holders did not adopt any method of pest control or soil testing.
- The educational status of operational holders was also recorded during the Survey where 11% were listed as illiterate, 19% up-to Class V, 21% middle school, 36% secondary school, 7% senior secondary school, 2% technical diploma holders below degree level and 4% were graduate and above. (**Table 10**)

- **Tables 11** shows that the average age of operational holders was 57 years. Maximum number of operational holders (31%) were found in the age group of 51 to 60 years. The second highest were found in the age group of 61-65 years with 19,305 nos. of operational holders. The least number of holders (755 nos.) was found in the age group of 18-30 years

It can be observed from the above pie chart that over 75% of operational holders enumerated were above the age of 50 years. It is also seen that out of the around 7% of operational holders listed in the age group of 18-40 years, the holders in the age group of 18-30 years contributed just 1.01%, which shows that the youth were involved in activities other than agriculture during the course of the survey.

- **Table 12** represents average household size of operational holders consisting of 7 nos. of size classes of families. The average household size of the operational holders accounted for around 5 family members. The highest household size recorded in the group of 4-6 family members. The least household was recorded in the size class of 10-12 family members with 1,298 nos.
